

Listing of Claims:

1. (previously amended) A device comprising:

a frame provided with an outer side wall and leg sections extending from said walls; and

a printed circuit board having a plurality of spaced holes, said leg sections extending through respective holes and being soldered to said printed circuit board so as to couple said frame to said printed circuit board, said printed circuit board having a part provided with at least one of said spaced holes and extending through said outer side wall.

2. (previously amended) The high-frequency device of claim 1, wherein said outer side wall is provided with at least one cut-out part, in which said leg section is located and through which said part of said printed circuit board extends upon coupling said frame to said printed circuit board.

3. (previously amended) The high-frequency device of claim 1, wherein said frame further comprises a plurality of outer side walls each provided with respective leg sections, said leg sections extending through respective holes located in respective parts of the printed circuit board, which extend through said outer side walls.

4. (previously presented) The high-frequency device of claim 1, wherein said frame further comprises one or more inner walls bridging said outer side wall and provided with respective leg sections.

5. (previously presented) The high-frequency device of claim 4, wherein said printed circuit board frame comprises inner and outer parallel surfaces delimited by said outer side wall and having one or more second throughgoing holes of said plurality of spaced holes, said throughgoing holes being configured to respective leg sections of said frame upon coupling said frame to said printed circuit board.

6. (previously presented): The high-frequency device of claim 1, wherein said printed circuit board extends perpendicularly to the outer side wall of said frame upon coupling said frame to said printed circuit board.

7. (currently amended): A high frequency device comprising:
a frame provided with a side wall; and
a printed circuit board having a plurality of spaced peripheral extensions,
said side wall of said frame and said peripheral extensions comprising respective
formations engaging one another upon coupling said frame to said printed circuit board,
wherein the peripheral extensions extend through the side wall.

8. (previously presented) The high-frequency device of claim 7, wherein the formations include a plurality of holes and a plurality of leg sections to extend through the holes upon coupling said frame to said printed circuit board.
